
Fujitsu Unveils World First MeeGo Netbook

Monday, 14 February 2011

The anticipation for the MeeGo operating system has died down considerably, judging by the fact that a large bulk of computer manufacturers have pulled the plug to develop electronics that would run on the MeeGo platform. However, Fujitsu intends to defy the consumer's expectations, whereby the company has just recently unveiled the world's first netbook that would run on MeeGo.

Basically, the Fujitsu LifeBook MH330 will run on an 1.66GHz Intel Atom N455 processor, and it will carry 1GB of RAM, and 250GB hard drive too. The netbook has a 10.1 inch LED backlit screen that sports 1024 x 600 pixels resolution too. And according to Fujitsu, this particular netbook will be available in Singapore, whereby prospective consumers can purchase one for \$400, which is pretty expensive, judging by the fact that it's a netbook.
